CLOSURE HYPOTHESIS · A SELF-REFERENTIAL COMPLETE HISTORY

$$\mathbf{T}(\mathfrak{U}) = \mathfrak{U}$$

one proposed structure: timeless history and intrinsic local computation

THREE AXIOMS AND ADDITIONAL REALIZATION CONDITIONS

AXIOM 1
twelve-port icosahedral carrier net on the sphere, complete reversible port response

AXIOM 2
observers agree on meaning under sharing, translation, coarse-graining
Ad_U D(v) = D(a·v)

AXIOM 3
no structure beyond what agreement forces (information projection: equal 1/12 port weights)

THE MACHINE (BOOK 1)

declared icosahedral carrier: twelve ports, thirty seams, A_5 of order 60
scalar mean update: T = I − L/60; limit fixed by initial mean
consensus protocol: read ports → compare → repair → record → checkpoint
public reality = what survives comparison and repair

CANDIDATE CLOSURES REQUIRE TYPED PHYSICAL SAME-CARRIER MAPS

LOCAL PIXEL FIXED POINT (conditional)
$\mathcal{P} = \varphi + \sqrt{\pi} / A_T(\mathcal{P})$
$$\mathcal{P}\star = 1.6309682414\ldots$$
screen area ↔ α_em: supplied same-carrier map
unique: interval Banach contraction 0.3041
unique inside declared map; physical bridge open

α_U(𝒫)

GLOBAL CAPACITY FIXED POINT (conditional)
N = log $M_0(\mathfrak{U}_N)$
$\log(N/\pi) = 6\pi/[\mathcal{P}\cdot\alpha_U(\mathcal{P})] - \mathcal{P}/24$
$$\text{candidate } N\star = 3.3001 \times 10^{122}$$
horizon-record identification required
comparison coordinate; no cosmic output yet

SI UNIT BRIDGE (not a closure): $\gamma\star = \ell\star\cdot\nu_Cs/c \approx 4.955974 \times 10^{-34}$
$\Rightarrow \ell\star^2 = 2.612280 \times 10^{-70}$ m² · K_cell = $4N\star/\mathcal{P}\star \cdot \Lambda\star\ell\star^2 = 3\pi/N\star$

ROUTE A · CARRIER → SUPPORT

extract carrier and support readouts

1 · SOURCE POSET + HEIGHT
longest parent-chain height
any poset compiles; Poisson 3+1 controls exact

2 · RANK-3 SOURCE QUOTIENT
unit directions ≈ S^2/null rays
30 links → port/null labels; 2/1/2; no local rank-3 cone

3 · FINITE PLACEMENT
auxiliary injective order → cone exists
two geometry checks → exact order embedding

4 · PHYSICAL LIMIT INPUTS
count-volume + independent dimension tests
manifoldlikeness + topology + tensor-curvature ID

SOURCE-DERIVED AMBIENT 1+3 CARRIER
$\mathbb{R} \times V_3$: ambient dim 4, (+−−−); carrier independent of height
auxiliary order → cone; two finite geometry checks → order ↔ cone
smooth manifold and physical causality: CONDITIONAL

FINITE EINSTEIN SHAPE
separate 3+1 tensor interface
9 balances + Ward/Bianchi

CONDITIONAL EFFECTIVE 3+1
signal causality + count-volume
refinement + manifold tests

CONDITIONAL SMOOTH GR PROMOTION
tensor curvature/null-balance + stress; coupling, vacuum, scale

PHYSICAL LIMIT BOUNDARY
compatibility controls supply no source-selected manifold refinement

ROUTE B · PORT RESPONSE → A_5 CURRENT

read the algebra off one local carrier

GAUGE-FORCING THEOREM
$P_{12} = 1 \oplus 3 \oplus 3' \oplus 5$, one fixed line, 11 = 3 + 8
$\mathfrak{g} = \mathfrak{u}(1) \oplus \mathfrak{su}(2) \oplus \mathfrak{su}(3)$
1 + 3 + 8 = 12, the gauge adjoint

CONDITIONAL GLOBAL FORM AND MATTER
(SU(3) × SU(2) × U(1)) / $\mathbb{Z}_6$: declared matter image
finite scan: 15 states, anomalies cancel, one Higgs
rank-three family band; physical attachment required

declared current and matter packet; attachment open
$\alpha^{-1} = 137.035660$: declared-map root
Higgs/top: conditional; no source-only mass
screen-grain reading: $\alpha^{-1} = 136.994835$

chart (80.330, 91.119): not physical poles
W/Z: physical pole and transport maps required
τ: conditional on balance and measured e, μ
face-sector Koide: Q = 2/3 on the balance branch

SHARED BY BOTH ROUTES · QUANTUM RULES AND THE HISTORY LAW

declared quantum algebra/state/instrument ⇒ Born and Lüders identities
exact Tsirelson bound 2√2 · central records shareable, others unclonable
one mean-action constraint ⇒ $p_\beta(\gamma) = q(\gamma)\, e^{(-\beta A(\gamma))/Z_\beta}$

PROPOSED CLOSURE · INTRINSIC LOCAL COMPUTATION

physics → chemistry → life → minds → records → recovered architecture
realization must preserve observable records and intervention dependencies
$\mathcal{P}\star$ and $N\star$ are unique candidates inside supplied maps

existence, uniqueness and physical realization require construction

CONDITIONAL UNIFICATION TARGET

three axioms + closure equations + named physical bridge receipts
α · G · c · Λ · M_H · W · Z · quarks · leptons · gauge group · conditional 3+1 spacetime
